Title: "Ergonomically Configured Shoulder Straps System"

Abstract

A dual strap system comprises two straps arranged to cooperate with the human form in a manner whereby a heavy side load is easily and comfortably supported. One strap has a conventionally shaped pad while the other has a specially shaped pad configured with a view to the forces which are applied to it and in further view of the angle in which rests upon a shoulder. Together, these straps are affixed at a joint to form an apparatus which may be worn over both shoulders. Length adjustability is effected in view of the unique arrangement by way of four specially placed adjustment buckles. Maximum utility is realized by minor adjustments whereby one can support heavy loads in the form a bag or satchel type sack at a user's side.
